Liver arrangement - schematic

Image: CMMurray

Schematic arrangement of liver structures as viewed from the caudal aspect (towards visceral surface)

Pig liver

Pig liver – diaphragmatic surface. A probe has been inserted into the caudal vena cava via the caval foramen in the remnant of diaphragm that has been left attached

Pig liver

Pig liver – visceral surface. The probe has been inserted into the caudal vena cava

Pig liver

Pig liver –visceral surface

Pig liver

Pig liver –visceral surface

Dog liver

Dog liver - Diaphragmatic aspect
(Millers Anatomy of the Dog)

Dog liver – diaphragmatic surface. The diaphragm is being elevated away from the liver to show the ligamentous attachments to the liver – the triangular and falciform ligaments extend from the coronary ligament that surrounds caudal vena cava.

Dog liver

Dog liver visceral surface
(Millers Anatomy of the Dog)

Dog liver – visceral surface
The probe has been inserted into the portal vein.
The blue arrow indicates the cystic duct.
